# Welcome To: Module 3

System Access and File System

Command Prompts and Getting Prompts Back

- What are command prompts?
  - A command prompt, also referred to simply as a prompt, is a short text at the start of the command line followed by prompt symbol on a command line interface

```
                                              root@MyFirstLinuxVM:~
File  Edit  View  Search  Terminal  Help
[root@MyFirstLinuxVM ~]#
```

   username   hostname   Prompt symbol

- To get your prompt back
  - `Ctrl + c`

Access to Linux System

Each operating system has a different protocol or client that is used to access the system

Example:

|		
Windows	=	Remote Desktop (RDP)
VMware ESX	=	vSphere client
Linux	=	Putty, SecureCRT
		SSH from Linux to Linux

ACCESS TO LINUX SYSTEM

Download and Install Putty

Access to Linux via Putty

New Network Command (ip)

- CentOS/RHEL 5 or 6 = **ifconfig**
- CentOS/RHEL 7 = **ip**
- CentOS/RHEL 7.5 and up = **ifconfig** command has been deprecated
- To use ifconfig in 7.5 = "**yum install net-tools**"

Important Things to Remember

- Linux has a super administrator account "root"

- "root" is the most powerful account that can create, modify, delete accounts and make changes to system configuration files

- Linux is a case-sensitive system

- Avoid using file names with spaces.

By: Imran Afzal

Changing Password

- You should change your initial password as soon as you login

Command = **`passwd userid`**

`Old password:` – enter your current password

`New password:` – enter your new password

**`Retype new password:`** – re-enter your new password

Linux File System

- OS store data on disk drives using a structure called a filesystem, consisting of files, directories, and the information needed to access and locate them.

- There are many different types of filesystems. In general, improvements have been made to filesystems with new releases of operating systems, and each new filesystem has been given a different name.

  E.g. ext3, ext4, XFS, NTFS, FAT etc.

- Linux filesystems store information in a hierarchy of directories and files

File System Structure

By: Imran Afzal
File System Structure and its Description

/boot	Contains file that is used by the boot loader (grub.cfg)
/root	root user home directory. It is not same as /
/dev	System devices (e.g. disk, cdrom, speakers, flashdrive, keyboard etc.)
/etc	Configuration files
/bin → /usr/bin	Everyday user commands
/sbin → /usr/sbin	System/filesystem commands
/opt	Optional add-on applications (Not part of OS apps)
/proc	Running processes (Only exist in Memory)
/lib → usr/lib	C programming library files needed by commands and apps
	`strace -e open pwd`
/tmp	Directory for temporary files
/home	Directory for user
/var	System logs
/run	System daemons that start very early (e.g. systemd and udev) to store temporary runtime files like PID files
/mnt	To mount external filesystem. (e.g. NFS)
/media	For cdrom mounts.

Navigating File System

- When navigating a UNIX filesystem, there are a few important commands:

    "cd"

    "pwd"

    "ls"

- "cd" stands for change directory. It is the primary command for moving you around the filesystem.

- "pwd" stands for print working directory. It tells you where you current location is.

- "ls" stands for list. It lists all the directories/files within a current working directory

- Using of TAB key to auto-complete

File System Paths

- There are two paths to navigate to a filesystem
  - ✓ Absolute Path
  - ✓ Relative Path

- An absolute path always begins with a "/". This indicates that the path starts at the root directory. An example of an absolute path is

  cd /var/log/httpd

- A relative path does not begin with a "/". It identifies a location relative to your current position. An example of a relative path is:

  cd /var

  cd log

  cd httpd

DIRECTORY LISTING ATTRIBUTES

Total columns = 9

Type	# of Links	Owner	Group	Size	Month	Day	Time	Name
drwxr-xr-x.	21	root	root	4096	Feb	27	13:33	var
lrwxrwxrwx.	1	root	root	7	Feb	27	13:15	bin
-rw-r—r--	1	root	root	0	Mar	2	11:15	testfile

The second column is the number of hard links to the file. For a directory, the number of hard links is the number of immediate subdirectories it has plus its parent directory and itself

By: Imran Afzal

Linux File Types

File Symbol	Meaning
-	Regular file
d	Directory
l	link
c	Special file or device file
s	socket
p	Named pipe
b	Block device

CREATING FILES AND DIRECTORIES

- Creating Files
  - ✓ touch
  - ✓ cp
  - ✓ vi

- Creating Directories
  - ✓ mkdir

By: Imran Afzal

Find Files and Directories

- Two main commands are used to find files/directories

  - `find`
  - `locate`

Difference Between find and locate

- **`locate`** uses a prebuilt database, which should be regularly updated, while **`find`** iterates over a filesystem to locate files. Thus, locate is much faster than find , but can be inaccurate if the database (can be seen as a cache) is not updated

- To update locate database run **`updatedb`**

By: Imran Afzal

WildCards

- A wildcard is a character that can be used as a substitute for any of a class of characters in a search

    - * - represents zero or more characters
    - ? - represents a single character
    - [] - represents a range of characters

By: Imran Afzal

Soft and Hard Links

- inode = Pointer or number of a file on the hard disk

- Soft Link = Link will be removed if file is removed or renamed

- Hard Link = Deleting renaming or moving the original file will not affect the hard link

  - `ln`
  - `ln -s`

Filesystem Color Definition

Filesystem Color Definition

- **Blue** = Directory
- **Green** = Executable or recognized data file
- **Sky Blue** = Symbolic link file

```
e.g. cd /home/iafzal
touch ca
cd /tmp
ln -s /homeiafzal/ca
```

Yellow with black background = Device

- **Pink** = Graphic image file
- **Red** = Archive file (tar)

Red with black background = Broken Link

```
e.g. cd /home/iafzal
touch ihulk
ln -s ihulk /tmp/ihulk
Absolute path for source file is missing
```
